

# Phenology Visualization

Moriah Young

January 20, 2021

COLLABORATORS: Phoebe Zarnetske, Mark Hammond, Pat Bills, Kara Dobson

DATA INPUT: Cleaned phenology data csv from the shared Google drive

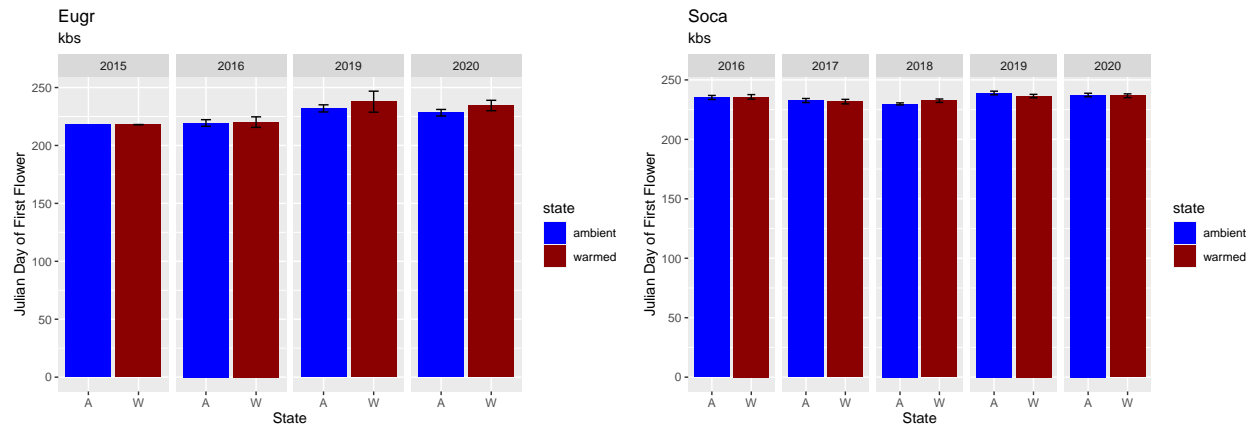

DATA OUTPUT: Code and Rmd are in the scripts folder in Github

PROJECT: warmXtrophic

This creates a plot for a given species and site and for every year

```
FirstFlower_plot <- function(spp, loc) {  
  FirstFlower_spp <- subset(sum_FirstFlower, species == spp & site == loc)  
  return(ggplot(FirstFlower_spp, aes(x = state, y = avg_julian, fill = state)) +  
    facet_grid(.~year) +  
    geom_bar(position = "identity", stat = "identity") +  
    geom_errorbar(aes(ymin = avg_julian - se, ymax = avg_julian + se), width = 0.2,  
      position = "identity") +  
    labs(x = "State", y = "Julian Day of First Flower", title = spp, subtitle = loc)  
    scale_fill_manual(values = c("blue", "darkred")) +  
    scale_x_discrete(labels=c("ambient" = "A", "warmed" = "W")) +  
    theme_grey()  
}
```

This creates a function that returns plots for a given site and year for average first date of flower comparing ambient vs warmed plots

```
sum_FirstFlwr_plot <- function(loc, yr) {
  FirstFlwr_sub <- subset(sum_FirstFlwr, site == loc & year == yr)
  return(ggplot(FirstFlwr_sub, aes(x = state, y = avg_julian, fill = state)) +
    facet_grid(.~year) +
    geom_bar(position = "identity", stat = "identity") +
    geom_errorbar(aes(ymin = avg_julian - se, ymax = avg_julian + se), width = 0.2,
      position = "identity") +
    labs(x = "State", y = "Julian Day of First Flower", title = yr, subtitle = loc) +
    scale_fill_manual(values = c("blue", "darkred")) +
    scale_x_discrete(labels=c("ambient" = "A", "warmed" = "W")) +
    theme_grey())
}
```

## KBS Plots
